

MOBILE PHONE PROOF OF ATTENDANCE SOLUTION FOR THE SECURITY INDUSTRY

REAL-LINK is a proof of attendance solution and lone worker protection tool that is ideal for the security industry. REAL-LINK utilises a variety of technologies such as NFC (near-field communication) phones and RFID (radio frequency identification) tags. By using REAL-LINK you will be able to immediately prove where your employees went, at what time, and what they did whilst there. This data can then be fed in real-time to any other system for further processing and analysis, or may be viewed from the REAL-LINK web based back-office application.

Benefits of Real-Link for the security industry

- Proof that your guards are performing the patrols that they should be and at the correct time, with alert to Supervisor by SMS or email if missed.
- Help to ensure the safety of your staff with Real-Link's attendance alert and emergency alert features.
- Provide evidence to your customers of when their sites have been patrolled and where the guards went.
- Easy to use solution that runs on a mobile phone so no need for separate devices such as PDA's.
- Ability to collect data on-site without filling in paper forms.
- All information available in real-time.
- Web based reporting allows any-time access to data for managers, authorities and even your clients.
- Charged on a monthly / quarterly subscription basis, no large initial start up costs.

Alerts and Lone-Worker Protection

REAL-LINK alerts enables a message to be sent via SMS or email if a location has not been visited within a certain time. If a guard has not reached a checkpoint, a supervisor can be alerted via SMS who can then try to determine why. This gives you the confidence that you are providing the best possible service to your customers whilst protecting your staff. REAL-LINK also has an alert feature that allows an employee to touch a tag (possibly their ID card or a keyfob) with their phone to create an alert in the back office system or dial a pre-determined number if they are in trouble.

How does it work?

- Employee carries NFC-enabled mobile phone containing Real-Link application
- Visits locations (office, warehouse, customer, vehicle, etc) that have pre-positioned RFID tags
- Touches tag with phone, which identifies who and where they are
- Phone can display a set of location-sensitive options that worker chooses from – may be a simple list of choices, or a data entry request (job number, mileage, status, etc.)
- Alternatively there is the touch and go option when no options are displayed on the phone and instead just the time, date, location and person are captured by simply touching the tag.
- All data is immediately transmitted via GPRS telephone network in real-time .
